

C++ Programming Assignment

Destructors and Copy Constructors

Instructions: Write, compile, and test each program. Use appropriate classes, constructors, copy constructors, destructors, and member functions.

1. Dynamic Integer Storage

Create a class Number that dynamically allocates memory for an integer using a pointer. Initialize the value using a constructor, implement a copy constructor to create a deep copy, and use a destructor to release the dynamically allocated memory.

2. Library Member Records

Create a LibraryMember class with member ID, name, and number of books issued. Initialize an object using a constructor and create another object using a copy constructor. Use a destructor to display a message when a member object is removed.
