

C++ Assignment – Containment of Objects

Topic: Containment of Two Objects

Assignment Problem Statement

Develop a C++ program for an Online Shopping Order Management System to demonstrate containment of objects.

Requirements

- Create a class Customer with data members such as customerId, customerName, and contactNumber.
- Provide suitable constructors and member functions to initialize and display customer details.
- Create a class Product with data members such as productId, productName, price, and quantity.
- Provide suitable constructors and member functions to initialize and display product details.
- Create a class Order that contains objects of both Customer and Product classes.
- The Order class should also store an orderId.
- Use constructors to initialize the contained Customer and Product objects.
- Calculate and display the total order amount based on product price and quantity.
- Create at least three Order objects and display complete order details.

Expected Output Details

For every order, display the Order ID, Customer details, Product details, Quantity, and Total Amount.
